

- Shifting the view for new beginnings
- You can create your own original training method

Our design concept is “Adjustable”

Introduction to Products Already Deployed or Considered for Deployment Overseas

Abdominal surgery, which places a heavy burden on patients, is largely coming to be replaced by more patient-friendly laparoscopic surgery. Suturing at the end of surgery is extremely important and requires continued practice every day. Expensive clinical needle holders have been used for practice until now, however, we sell lower priced training needle holders, which are just as good as the clinical type. These are being used by major training centers not only in Japan but also Taiwan.

Your Company's Top 5 Strengths

- 1 Training methods can be freely compiled for personnel ranging from novice interns to skilled doctors.
- 2 The inexpensive training needle holders, which we have developed based on medical-engineering collaboration to be just as good as the clinical type, are hugely popular in Japan and overseas.
- 3 Products can be selected according to doctors' needs.
- 4 Through selling products in small lots, we have sales maneuverability that majors cannot match.
- 5 Our products keep doctors motivated.

Reasons you are chosen

- 1 Low prices but high quality
- 2 Products that enable doctors to practice anytime and anywhere
- 3 Practice can be modified to prevent falling into a rut

Reasons you are trusted

- 1 Product development from perspectives that nobody else can think of
- 2 We want to assist doctors who regularly train with enthusiasm
- 3 Highly rated by well-known doctors in Japan and overseas
